

Integrated Chlorine Dioxide Systems For All Types of Water Disinfection

- Founded in 1998
- Available worldwide
- 35 years experience in water disinfection
- Safety as a top priority

Halox Technologies, manufactures, sells and supports electrochemical systems and ancillary equipment for generating, delivering, and measuring chlorine dioxide (ClO₂), a highly effective biocide. Major applications include healthcare facilities, food and beverage processing, potable water systems and cooling towers.

Founded in 1998, the company maintains corporate headquarters in Bridgeport, Connecticut. Here, Halox Technologies is housed in a modern facility that contains all of the company's administrative, research and development, and manufacturing. The company has representation throughout the world.

With an ever-expanding population and a finite fresh water supply, the world is in need of safe, effective technology for water purification. Infectious diseases kill over 17 million people a year. Water, once considered safe, is now found to contain such harmful microorganisms as Cryptosporidium, E. Coli, Listeria and Legionella.

Halox offers self-contained chlorine dioxide generators that produce up to five and one-half pounds and more of ClO₂ per day in safe and effective concentrations. The generators are simple to operate and generate a very pure product that is cost effective. Halox ClO₂ generators provide a pure, continuous supply of chlorine dioxide at a surprisingly low cost.

Halox Technologies places quality as a top priority. We strive for excellence in everything we do. Our goal is complete customer satisfaction. We are also committed to bringing a high level of quality awareness to every employee. Our goals are achieved through management commitment, effective training, well-documented procedures, and total employee involvement in our quality programs. Quality is our corporate philosophy and is woven into the fabric of the Halox organization.
